This week I will be working with the students on the switch statement. I will pass
the students a worksheet with some code written on it. They will work in teams to come
up with an answer based on some parameters that I give them on the whiteboard. I will
assign the students roles based on what I see they need improvement on. The code that I
give them will be deeply nested and therefore will require the students to really think
about the output. This assignment will take about 25 to 30 minutes.

The rest of the class time will be devoted to helping the students with their lab
assignments. I will go around to each individual and ask them if they need any
clarification on the material given in class. This will give me an overlook as to how the
students are coping with the class.
