This week’s material is on user-defined methods. This gives me a great opportunity to have the students work in teams in order to come up with answers to some scenarios that I give them. I will stress the different types of methods and the many ways to use them. I will go over void methods and returning methods. I will explain the static signature and briefly explain the use of public protected and private. Then I will explain how to properly use a method. This is an important section for the students so I will be careful not to get carried away with filling their heads with material but rather address any fuzzy spots that the students might have.

Again, the note cards will be used to take role and address any questions the students might have. This week I will be using the classroom for my session. I want to get the students away from the computers in order to focus on the material.
